UNIGUEST™ AND PC GUARDIAN® INTRODUCE USB SECURITY PROTECTION DEVICE FOR HOTEL INDUSTRY TO COMBAT DATA LEAKAGE

Anti-theft USB Port Security System now available to prevent illegally obtained user data from PC Workstations among hotels

(Nashville, TN) – Uniguest and PC Guardian are pleased to announce a breakthrough in hotel Public PC Workstation security. In response to the reports of illegal keystroke hardware logging devices found in front desk and business center computer workstations among hotels, Uniguest, in conjunction with PC Guardian, are now offering an exclusive and simple-to-install device to eliminate further security risk to both hotels and their customers.

“One of Uniguest’s primary functions as a company is to provide security protection for users of automated public PC workstations. We took the initiative on behalf of our customers and found a manufacturer, PC Guardian, that produces a device that will prevent someone from unplugging the USB keyboard and installing the “KeyKatcher” or similar device into a workstation and obtaining personal data from users,” says Uniguest President and CEO Shawn Thomas. “We strive to offer our customers immediate solutions to their security concerns. We are pleased to announce this new relationship with PC Guardian offering our clients a complete line of PC security components and the latest prevention device, the USB Port Security System.”

The innovative and simple PC Guardian USB Port Lock reduces the risk of data leakage, data theft, computer viruses, and malware by physically blocking USB ports from unauthorized access. This versatile security system effectively offers instant, maintenance-free, data protection that eliminates the burden of software installations and updates. The USB Port Security System can protect single or multiple USB ports while allowing continued secured use of authorized USB devices.

“The USB Port Security System installation is simple, taking only moments and can eliminate the necessity of upper hotel management’s constant supervision of the Public PC Workstations,” says Harry Ganter, Uniguest’s Operations Manager. “We will work with companies that provide public PC workstations to assist in the integration of this system as a deterrent of user data exploitation.”

Uniguest designs, develops, software-protects, and services Automated Public PC Workstations and is the largest service provider to the hotel industry servicing over 1,500 hotels representing a network of over 2,100 PC’s.

This exclusive technology is now available through Uniguest, as a distributor for PC Guardian.
